

Liquid Ultrasonic Flowmeter for Permanent Installation

Designed for wall mounting or installation in 19" rack systems

Features

- Precise bi-directional and highly dynamic flow measurement with the non-intrusive clamp-on technology
- High precision at fast and slow flow rates, high temperature and zero point stability
- Automatic loading of calibration data and transducer detection for a fast and easy set-up (less than 5 min), providing precise and long-term stable results
- User-friendly design
- Transducers available for a wide range of inner pipe diameters (0.25...256 in) and fluid temperatures (-40...+752 °F), applications down to -276 °F possible
- FM Class 1 Div. 2 approved transducers for hazardous areas available
- HybridTrek automatically switches between transit time and NoiseTrek mode of measurement when high particulate flows are encountered

Applications

- Chemical industry
- Petrochemical industry
- Oil and gas industry
- Pharmaceutical industry
- Semiconductor industry
- Mechanical engineering
- Water and wastewater industry

Function

Measurement Principle

Transit Time Difference Principle

In order to measure the flow of a medium in a pipe, ultrasonic signals are used, employing the transit time difference principle. Ultrasonic signals are emitted by a transducer installed on the pipe and received by a second transducer. These signals are emitted alternately in the flow direction and against it.

As the medium in which the signals propagate is flowing, the transit time of the ultrasonic signals in the flow direction is shorter than against the flow direction.

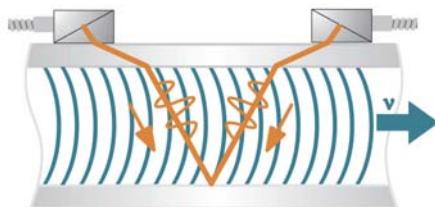

The transit time difference, Δt , is measured and allows the flowmeter to determine the average flow velocity along the propagation path of the ultrasonic signals. A flow profile correction is then performed in order to obtain the area averaged flow velocity, which is proportional to the volumetric flow rate.

Two integrated microprocessors control the entire measuring process. This allows the flowmeter to remove disturbance signals, and to check each received ultrasonic wave for its validity which reduces noise.

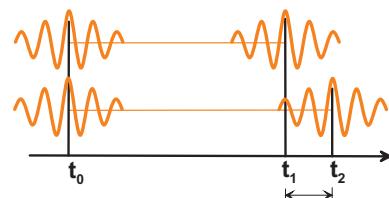

HybridTrek

If the gaseous or solid content in the medium increases occasionally during measurement, a measurement with the transit time difference principle is no longer possible. NoiseTrek mode will then be selected by the flowmeter. This measurement method allows the flowmeter to achieve a stable measurement even with high gaseous or solid content.

The transmitter can switch automatically between transit time and NoiseTrek mode without any changes to the measurement setup.

Path of the ultrasonic signal

Transit time difference Δt

Calculation of Volumetric Flow Rate

$$\dot{V} = k_{Re} \cdot A \cdot k_a \cdot \Delta t / (2 \cdot t_f)$$

where

\dot{V}	=	volumetric flow rate
k_{Re}	=	fluid mechanics calibration factor
A	=	cross-sectional pipe area
k_a	=	acoustical calibration factor
Δt	=	transit time difference
t_f	=	transit time in the medium

Number of Sound Paths

The number of sound paths is the number of transits of the ultrasonic signal through the medium in the pipe. Depending on the number of sound paths, the following methods of installation exist:

- **reflect mode**

The number of sound paths is even. Both of the transducers are mounted on the same side of the pipe. Correct positioning of the transducers is easier.

- **diagonal mode**

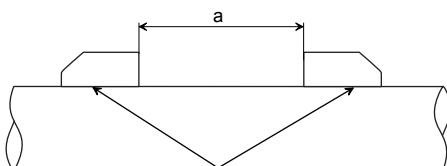

The number of sound paths is odd. Both of the transducers are mounted on opposite sides of the pipe.

- **direct mode**

Diagonal mode with 1 sound path. This should be used in the case of a high signal attenuation by the medium, pipe or coatings.

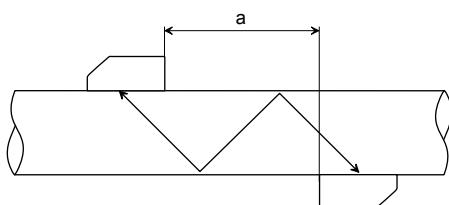

The preferred method of installation depends on the application. While increasing the number of sound paths increases the accuracy of the measurement, signal attenuation increases as well. The optimum number of sound paths for the parameters of the application will be determined automatically by the transmitter.

As the transducers can be mounted with the transducer mounting fixture in reflect mode or diagonal mode, the number of sound paths can be adjusted optimally for the application.

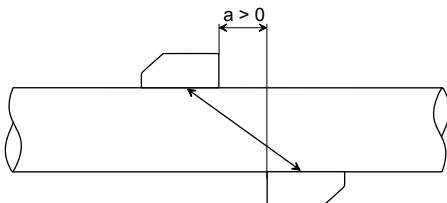

a = transducer distance

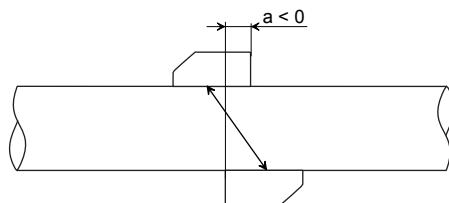

Reflect mode, number of sound paths: 2

Diagonal mode, number of sound paths: 3

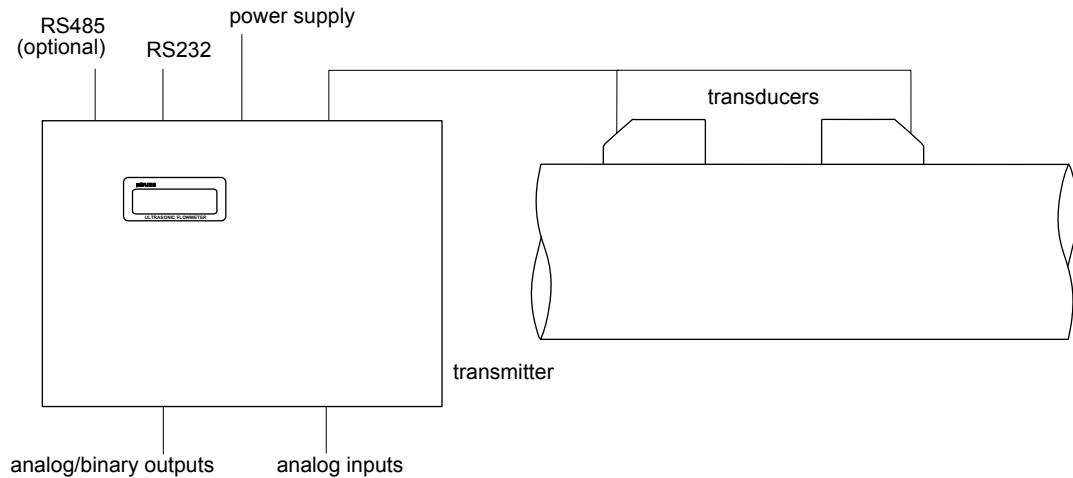

Direct mode, number of sound paths: 1

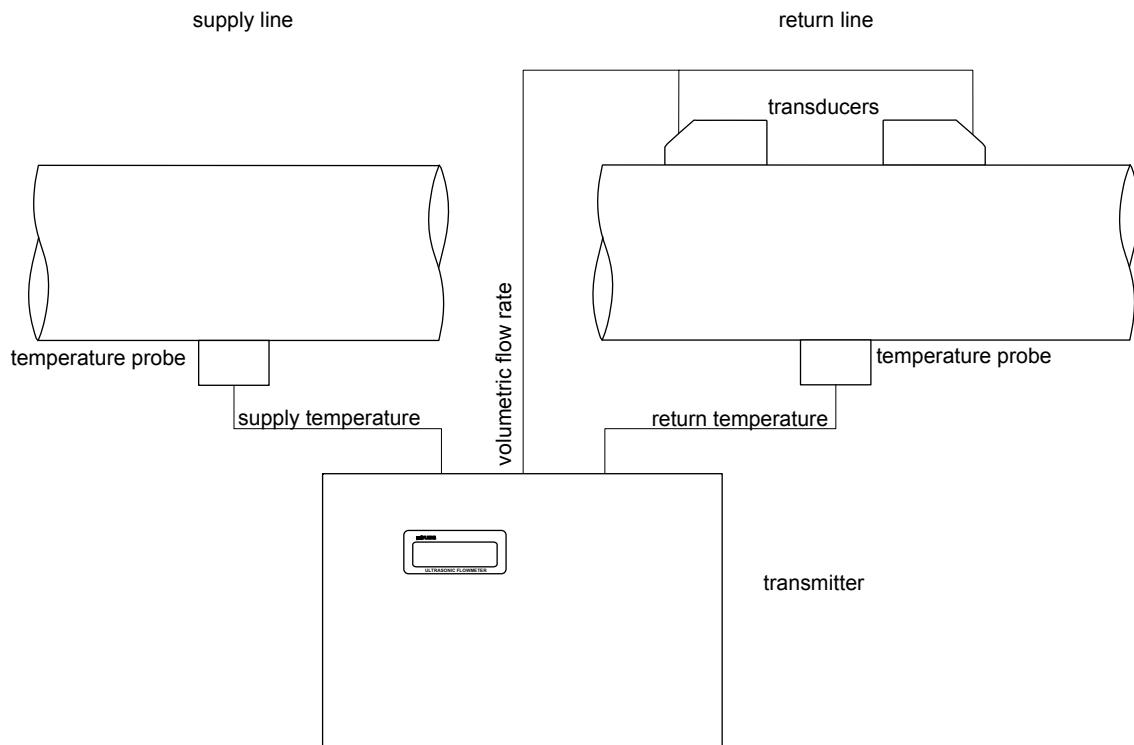

Direct mode, number of sound paths: 1,
negative transducer distance

Typical Measurement Setup

Example of a measurement setup in reflect mode

Example of a heat flow measurement

coupling foil type A	990739-7	max. 536	plomb	
coupling foil type B	990739-8	> 536 to 752	silver	
coupling foil type VT	990739-0	14 to 302, short-time peak max. 392	fluoroelastomer	for transducers with transducer frequency G, H, K
	990739-6			for shear wave transducers with transducer frequency M, P
	990739-14			for shear wave transducers IP68 and Lambwave transducers with transducer frequency M, P
	990739-15			for shear wave transducers with transducer frequency Q
	990739-5			for Lambwave transducers with transducer frequency Q

Connection Systems

connection system TS		
connection with extension cable	direct connection (only ADM 7407)	transducers technical type
		****L*
		****52

transducer frequency (3d character of transducer order code)		G, H, K		M, P		Q		S	
T	cable length	x	16	I	≤ 984	x	9	I	≤ 295
	cable length (option LC)	29	≤ 984	-	-	-	-	-	-
	cable length (option IP68)	39	≤ 984	39	≤ 984	-	-	-	-

x = transducer cable length

l = max. length of extension cable

Transducer Cable

Technical Data

		transducer cable			extension cable
type		1699	2550	6111	2615
connection system					TS
standard length	ft	see table above			-
max. length	ft	-			see table above
operating temperature	°F	-67 to +392	-40 to +212	-148 to +437	-40 to +158
properties		longitudinal water tight			halogen free fire propagation test according to IEC 60332-1 combustion test according to IEC 60754-2
sheath					
material		stainless steel 304	-	stainless steel 304	-
